

## Updates

- The overall appearance of references has been improved – with updates to font-size, icon-size and author/institution names/links. These changes have reduced visual clutter for document results.
- The **history** description per hitset has been improved, leading to clearer identification of the applied operation that has led to the result set.
- Some users have experienced difficulties when trying to access new Reaxys, while they were able to run Reaxys Version 1 without issues. This has been resolved.
- For similarity searches the **results preview** now displays the structure query, when clicking the structure icon, rather than the structure file contents.
- **Query Builder:** it is no longer required that all dragged-in querylets need a setting or value, before a search can be performed. Only if all querylets of a given query are empty/not defined a warning hint is provided explaining that you first have to define a query.
- **Results page** improvements:
  - Within document results the patent classification is included in the Front Page information.
  - In Reaction results the non-numerical yields are now displayed and unknown yields display as 'n/a'.
